

With CVap® Ovens, you don't have to worry about hood space or placement.

Pocket thousands by omitting an unneeded hood from your floor plan.

Independent lab Intertek tested our CVap® Ovens, using the EPA's **Method 202 Condensible Particulate Matter** standard. The Intertek test data proved that Winston's CVap Ovens release grease emissions at a level that allows them to safely operate hoodless. EPA regulations specify that grease emissions from cooking appliances can't exceed 5.0 mg (milligrams) per 3 cubic meters. Intertek testing showed that the grease emissions from our RTV5 Oven were 0.265 mg per 3 cubic meters, well below the 5.0 mg limit. The report concludes that this data is acceptable for all Winston CVap RTV, CHV, and HOV models.
